Containers With Docker

Lab 01

Docker Container Lifecycle Lab

•

-

You are Welcome

Tasks :

Step 1: Create Containers:

Create two containers without starting them.

Container 1

- Name: web-server
- Image: nginx

Container 2

- Name: linux-tester
- Image: alpine
- Command: sleep 3600

Step 2: Start Containers

Start both containers.

Step 3: Execute Commands Inside Containers

NGINX Container

Display running process

Alpine Container

Create a directory. /app

Create a file inside /app

Step 4: Inspect Containers

Display detailed information about:

- web-server
- linux-tester

Verify:

- Container ID
- Image
- Status

Step 5: Stop Containers

Stop both containers and verify

Step 6 : Delete Containers

Delete:

- linux-tester

Step 7: Force Delete Running Container

Delete:

- web-server
even if it is running.

how to create a custom Docker Image from a running container ?

Requirements

Base Image : ubuntu:22.04

Container Name: dev-server

New Image Name : my-ubuntu:v1

Step 1: Create and Run Container

Run Ubuntu container in interactive mode.

Step 2: Access Container

Step 3: Install Packages

Step 4: Create Custom Files

Step 5: Create New Image Using Commit

Step 6: Verify New Image
